GILBERT M., HATSON D.C., CUNNINGHAM A.-M., JENNINGS M.P., YOUNG N.M.,

J. BIOL, CHEM. 271:28271-28276(1996).

-I-FUNCTION: TRANSFERS SIALIC ACID FROM THE SUBSTRATE CMP-SIALIC
ACID DONOR TO THE TERMINAL
BETA-D-GALACTOSYL-1, 4-ACETYL-BETA-D-GLUCOSAMINE ON THE
LACTO-N-NEDTETRAGOSE BRANCH OF THE LIPOOLIGOSACCHARIDE.

-I-CATALYTIC ACTIVITY: CMP-N-ACETYLNEURAMINATE +
BETA-D-GALACTOSYL-1, 4-ACETYL-BETA-D-GLUCOSAMINE - CMP +
ALPHA-N-ACETYLLNEURAMINYL-2, 3-BETA-D-GALACTOSYL-1, 4-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALPHA-N-ACETYL-BETA-ALP

N-FSDB; QR/823.

The encoding human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for developing prods. for studying calcium channels, e.g. for obtainhing agonists and antagonists.

To isolate DNA encoding the Beta I subunit, a human hippocampus con the product of the Beta I subunit, a bush is selected and was in turn used to isolate encoding a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate converlaping clones encompassing DNA encoding the entire human calcium channel beta 2 subunit were isolated and sequenced. Five alternatively spliced forms of the beta I subunit have been identified. These forms are designated beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-2, expressed in the calls. Full-length DNA clones encoding the beta 1-2 and beta 1-3 subunits have been constructed. The subunits beta 1-1 and beta 1-2 and beta 1-2, expressed in milling subunit. Sequences of the beta 1 spliced forms of the calls and pilication analysis as alternatively spliced forms of the beta subunit. Sequences of the beta 1 splice variants are set forth in QBT88172611, QBT839/R72612 and QQBT831-QBT833 and

DNA encoding human calcium channel alpha 1B sub:unit protein - useful for recombinant production of the channel for screening of its modulators, and diagnosis of Lambert Eaton Syndrome Disclosure; Columns 27-230; 166pp; English.

The present sequence represents the beta-5 subunit of a human calcium channel. Calcium channels are membrane-spanning, multi-subunit proteins that allow controlled entry of calcium ions into cells. This leads to depolarisation events required for muscle contraction. The recombinant subunit, when expressed with nucleic acids encoding the complete calcium channel, can be used in assays for the detection and characterisation of compounds that modulate the channel. The DNA encoding the subunits can
                                                                                                                                                                                                                                                                                              DNA encoding human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for developing prods. for studying calcium channels, e.g. for obtaining agonists and antagonists.

PT developing prodists and antagonists

CT oisolate DNA encoding the Beta I subunit, a human hippocampus comparing the arabit sweletal muscle calcium channel beta subunit.

CA hybridising clone was selected and was in turn used to isolate cancoding the entire human calcium channel beta subunit.

A hybridishing clones until the overlapping clones encompassing DNA encoding the entire human calcium channel beta 2 subunit were concoling the entire human calcium channel beta 2 subunit were beta 1-1, expressed in sheletal muscle, beta 1-2, expressed in the CNS, beta 1-1, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3 subunits have been constructed. The subunits beta 1-3 subunits have been constructed. The subunits beta 1-3 beta 1-2, cancoding the beta 1-3 beta 1-2, cancoding the beta 1-3 beta 1-2, expressed in the CNS beta 1-4 and beta 1-5 have been identified by nucleic acid beta 1-4 and beta 1-5 have been identified by nucleic acid beta subunit. Sequences of the beta 1 splice variants are set forth in QR7808/R72611, QR7883/R72612 and QQR881-QR888/R72611, QR7884/R72612 and QQR881-QR888/R72611, QR7884/R72612 and QQR881-QR888/R72611, QR7884/R72612 and QQR881-QR888/R72611, CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR888-CR8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
be alternatively spliced when transcribed, giving more than one form of the protein from the same transcript, each having slightly different properties. In addition, the reactivity of the alpha I subunit with Igg molecules from the serum of an individual with Lambert Eaton Syndrome (LES) can be used as a diagnostic for the disease.
                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mer purified myasthenic antigenic polypeptide and its corresp. antibody - useful for diagnosing and treating proliferation of neoplastic cells in patient with Lambert-Eaton myasthenic syndrome claim 5; Page 26-27, 48pp; English.

The sequence is that of myasthenic antigenic polypeptide (MAP) encoded by the cDNA clone p mysB. MAP can be used to detect antibodies associated with paraneoplastic sensory neuronopathy such as Lambert-Eaton myasthenic syndrome (LEMS). These antibodies are used to determine if a patient with neurological symptoms has a fumour expressing MAP, to inhibit proliferation of neoplastic cells in LEMS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The present sequence and the channel alpha lb sub:unit protein - useful for recombinant production of the channel for screening of the useful for recombinant production of the channel for screening of the medialacries, and diagnosis of Lambert Eaton Syndrome Claim 3; Columns 217-220; Löfep; English.

The present sequence is encoded by a splice variant of the beta subunit of an achieum channel. Calcium channels are membrane-spanning, multi-subunit proteins that allow controlled entry of calcium ions into contraction. The recombinant subunit, when expressed with nucleic acids contraction and characterisation of compounds that modulate the channel. The DNA encoding the subunits can be alternatively spliced when transcribed, giving more than one form of the protein from the same transcribed, giving more than one form of the protein from the same transcribed, giving more than one form of the protein from the same transcribt, each having slightly different properties. In addition, the rection and variance and alternatively from the serum of an individual with Lambert Eaton Syndrome (LES) can be used as a diagnostic for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                    for agonists and antagonists of calcium channels for agonists and antagonists of calcium channels.

A first oligonucleotide probe (Q46075) complementary to nucleotides 361-400 of the VDCC beta-subunit from rabbit skeletal muscle was used to screen a human hippocampus cDNA library. A 1.9kb cDNA fragment was isolated for further screening to isolate human VDCC beta-subunit coding sequences. Clone HBB1 was sequenced and found sequence R39563 was deduced from the open reading frame.

To isolate DNA encoding the Beta I subunit, a human hippocampus converted by hybridisation to a DNA fragment encoding a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate overlapping clones until the overlapping clones encompassing DNA encoding the entire human calcium channel beta 2 subunit were sociated and sequenced. Five alternatively spliced forms of the beta 1 subunit have been identified. These forms are designated beta 1 subunit have been identified. These forms are designated beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-1, expressed in the CNS beta 1-4 expressed in the CNS beta 1-4 and beta 1-5 have been identified by nucleic acid subunits have been constructed. The subunits beta 1-1, beta 1-2, and beta 1-2 and beta 1-3 an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for obtainfng agonists and antagonists

The developing prods. for studying calcium channels, e.g. for obtainfng agonists and antagonists

To isolate DNA encoding the Beta I subunit, a human hippocampus

CODNA library was screened by hybridisation to a DNA fragment encoding a rabbit skeletal muscle calcium channel beta subunit.

A hybridising clone was selected and was in turn used to isolate coverlapping clones until the overlapping clones encompassing DNA encoding the entire human calcium channel beta 2 subunit were isolated and sequenced. Five alternatively spliced forms of the beta I subunit have been identified. These forms are designated beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-3, also expressed in the CNS, beta 1-1, expressed in the CNS, beta 1-2 and beta 1-3 subunits have been constructed. The subunits beta 1-2 beta 1-2, beta 1-2, cannot an an an an an an allysis as alternatively spliced forms of the beta 1-4 and beta 1-5 have been identified by nucleic acid amplification analysis as alternatively spliced forms of the beta subunit subunit
Disclosure; Page 129-131; 150pp; English.

Five alternatively spliced forms of the human calcium channel beta I subunit have been identified and DNA encoding a number of forms have been identified and DNA encoding a number of forms have been isolated. These forms are designated beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-3, also expressed in the CNS, beta and HEK 293 cells, and beta 1-5, expressed in HEK 293 cells.
                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Dividing human calcium channel alpha 1B sub:unit protein -

useful for recombinant production of the channel for screening of

useful for recombinant production of the channel for screening of

useful for recombinant production of Lambert Eaton Syndrome

claim 3: Columns 223-226; 166pp; English.

The present sequence represents the beta-1 subunit of a human calcium

channel, calcium channels are membrane-spanning, multi-subunit proteins

that allow controlled entry of calcium ions into cells. This leads

to depolarisation events required for muscle contraction. The recombinant

subunit, when expressed with nucleic acids encoding the complete calcium

channel, can be used in assays for the detection and characterisation of

compounds that modulate the channel. The DNA encoding the subunits can

be alternatively spliced when transcribed, giving more than one form of

the protein from the same transcribe, each having slightly different

properties. In addition, the reactivity of the alpha 1 subunit with IgG

molecules from the serum of an individual with Lambert Eaton Syndrome

(LES) can be used as a diagnostic for the disease.

The present sequence represents the beta subunit of a human calcium channels are membrane-spanning, multi-subunit channel. Calcium channels are membrane-spanning, multi-subunit mortaling that allow controlled entry of calcium ions into cells.

This leads to depolarisation events required for muscle contraction. The recombinant subunit, when expressed with nucleic acids encoding the complete calcium channel, can be used in assays for the detection and characterisation of compounds that modulate the channel. The DNA encoding the subunits can be alternatively spliced when transcribed, glving more than one form of the protein from the same transcript, each having alightly different properties. In addition, the cactivity of the alpha 1 subunit with IgG molecules from the serum of an individual with Lambert Eaton Syndrome (LES) can be used as a individual with Lambert Eaton Syndrome (LES) can be used as a squence 530 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human neuronal beta-unit cDNA of voltage dependent calcium channels - useful in calcium-flux studies and screening systems for agonists and antagonists of calcium channels

Claim 2: Page 11-13; 13pp; German

A first oligonucleotide probe (046075) complementary to nucleotides 361-400 of the VDCC beta-subunit from rabbit skeletal muscle was used to screen a human hippocampus CDNA library. A 1.9kb cDNA beta-subunit coding sequences. Clone HBB3 was sequenced and nucleotides 1-1288 were found to have 92% homology to the rabbit The anino acid sequence and coding sequence is no detectable homology. The anino acid sequence R39565 was deduced from the open reading frame. See also 046076 and 046077.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DNA encoding human calcium channel sub-unit(s) - used for developing prods. for studying calcium channels, e.g. for obtaining agonists and antagonists
Disclosure; Page 163-165; 285pp; English.

To isolate DNA encoding the Beta I subunit, a human hippocampus CDNA library was screened by hybridisation to a DNA fragment ancoding a rabbit skeletal muscle calcium channel beta subunit. A hybridising clone was selected and was in turn used to isolate overlapping clones until the overlapping clones encompassing DNA encoding the entire human calcium channel beta 2 subunit were isolated and sequenced. Five alternatively spliced forms of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

beta 1 subunit have been identified. These forms are designated beta 1-1, expressed in skeletal muscle, beta 1-2, expressed in the CNS, beta 1-4, expressed in the CNS, beta 1-4, expressed in acorta tissue and HEK 293 cells, and beta 1-5, expressed in HEK 293 cells. Full-length DNA clones encoding the beta 1-2 and beta 1-3 subunits have been constructed. The subunits beta 1-1, beta 1-2, amplification analysis as alternatively spliced forms of the beta subunit. Sequences of the beta 1 splice variants are set forth in QNF038/R72611, QNF039/R72612 and QQNF031-QNF033 and

L HUM. MOL. GENET. 2:863-868(1993).

L HUM. MOL. GENET. 2:863-868(1993).

L FUNCTION. THIS PROTEIN IS THE BETA SUBUNIT OF THE DIHYDROPYRIDINE.

C HONDENSTITYE CALCIUM CHANNEL. PLAYS A ROLE IN EXCITATION.

C CONTRACTION COUPLING. THE SKELETAL MUSCLE DHP-SENSITIVE CA(2+)

C CHANNEL MAY FUNCTION ONLY AS A MULTIPLE SUBUNIT COMPLEX.

C HONDEL MAY FUNCTION ONLY AS A MULTIPLE SUBUNIT. COMPOSED OF RIVE SUBUNITS: ALPHA-1, ALHA-2, BETA, GAMMA AND DELTA.

THE CYTOPLASMIC ASPECT OF THE SARCOLEMMA.

THE CYTOPLASMIC ASPECT OF THE SARCOLEMMA.

C HOSSUB SPECIFICITY: SKELETAL MUSCLE.

C HISSUE SPECIFICITY: SKELETAL MUSCLE.

C HISSUE SPECIFICITY: SKELETAL MUSCLE.

SUBUNIT ARE PRODUCED BY ALTERNATIVE SPLICING OF THE GENE.

SUBUNIT ARE PRODUCED BY ALTERNATIVE SPLICING OF THE GENE.

SIMILARITY: TO OTHER CALCIUM CHANNEL BETA SUBUNITS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. ALPHA-1, ALPHA-2, BETA AND GAMMA.
-1-SUBCELLULAR LOCATION: PERIPHERAL MEMBRANE PROTEIN ASSOCIATED WITH
THE CYTOPLASMIC ASPECT OF THE SAFCOLEMMA.
-1-ALTERNATIVE PRODUCTS: THREE, TISSUE-SPECIFIC, FORMS OF THE BETA-1
SUBUNIT ARE PRODUCED BY ALTERNATIVE SPLICING OF THE GENE (BY
SIMILARITY:
-1-SIMILARITY: CONTAINS I SH3 DOMAIN.
-1-SIMILARITY: TO OTHER CALCIUM CHANNEL BETA SUBUNITS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FUCKERZI V., ROEHRKASTEN A., BIEL M., BOSSE E., REGULLA S., MEYER H.E.,

-I- FUNCTION: THIS PROTEIN IS A SUBUNIT OF THE DIHYDROPYRIDINE (DHP) SERNSTIVE CALCIUM CHANNEL (BY SIMILARITY).

-I- SUBUNIT: THE L-TYPE CALCIUM CHANNEL IS COMPOSED OF FOUR SUBUNITS:

-I- TISSUE SPECIFICITY: EXPRESSED IN ALL TISSUES.

-I- TISSUE SPECIFICITY: EXPRESSED IN ALL TISSUES.

-I- TISSUE SPECIFICITY: TYPE FORMS ARE PRODUCED BY ALTERNATIVE SPLICING OF THE GENE.

-I- SIMILARITY: CONTAINS 1 SH3 DOMAIN.

-I- SIMILARITY: TO OTHER CALCIUM CHANNEL BETA SUBUNITS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PFAM; PF00018; SH3; 1.

"ERKI, an unusual member in the family of hormone receptors with
seven transmembrane segments.";
GENOMICS 26:334-344(1995).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TECHNICATION: PROBABLY INVOLVED IN CELLULAR RESPONSE TO A HORMONE OR N INTERACTION WITH A PROTEIN LIGAND.

1 SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

1 TISSUE SPECIFICITY: WIDE EXPRESSION; INCREASED LEVELS IN PERIPHERAL BLOOD MONONCLEAR CELLS.

1 PIN: N - AND O-GLYCOSYLATED; (POSSIBLE).

1 FIM: N - AND O-GLYCOSYLATED; (POSSIBLE).

1 SIMILARITY: CONTAINS 6 GEF-LIKE DOMAINS.

1 SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPTORS.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The tissue source for this library is xylem. The xylem
tissue was harvested in spring and summer from branches
of seed orchard trees which are clones of the same
genotype. Branches were 4-6 inches in diameter. The cDNAs
were directionally cloned into Lambda Zap and were
rescued as a Bluescript derivative in the EcoRI and XhoI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Chordata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

Cenomic DNA (179053) from phage T4 includes open reading frames

Cenomic DNA (179053) from phage T4. Sp36 and gp37 (R97370, R97372-74), that comprise the tail fibres of the phage, as well

R97372-74), that comprise the tail fibres of the phage, as well

S an open reading frame encoding an unknown protein (R97371).

Cene sequences encoding native, modified or recombined tail fibre proteins can be incorporated into expression vectors to allow mass proden of the proteins in microbial hosts. Tail fibre proteins

C including fusion proteins) having novel structures are useful as building blocks for nanostructures having defined, adjustable, dimensions for use e.g. in filters and molecular sieves.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 3; Page 14; 23pp; English.
Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

Random point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a
single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules which terminate at all
possible nucleotide positions within a specified region. The
variable j' ends generated in this way are used as primers for
reverse transcriptase. Nucleotides are misincorporated by the
transcriptase and the molecules are completed to forms that can be
amplified and then expressed in a suitable host-vector system.
The sequence covers all 176 difft base substitutions, most of which
cocurred singularly in any given mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 759 atttgtagttccaagagcaagtaaatcagcatcagcatataactgagctttaagataaag 700

Oligonucleotide probe MK14*A consists of nucleotides 5-95 of 10510315). It hybridized to all spp. of mycobacteria tested, 1 cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q517475.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-MAY-1994 (first entry)

Introducing random point mutations into nucleic acods -
by prepn of single stranded template, annealing a primer, elongation, misincorporation, completion of molecules and screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Random point mutations were introduced into the alpha fragment of Random point mutations were introduced into the alpha fragment of E.coll beta-galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3 ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps

This sequence represents a human or mammalian DNA replication origin

This sequence represents a human or mammalian DNA replication origin

Consensus sequences of the invention, designated uniorsconsensus.

Consensus sequences of the invention, designated uniorsconsensus.

Administration of the consensus sequence or an anti-gene (comprising a double stranded copy of the consensus) is used to inhibit DNA replication

In vivo or in vitro. The consensus sequences can also be inserted into an expression vector, used subsequently for in vitro transfection of mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of semi-conservative replication in proliferating mammalian cells, or inserted into mammalian or human artificial chromosome vectors for gene therapy. Particularly, they are used to create shuttle vector constructs for defining the essential mammalian elements required for maintenance of chromosomal function. The consensus sequence can be combined with cloned human telomeres and maintained as bacterial plasmids, circular or artificial chromosomes and maintained as bacterial plasmids, circular or an analyse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins comprising a binding domain and an effector domain bisclosure; page 35, 255pp; English.

070465 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generic formula can also be represented as follows: X(NNB)6(TGC)(NNB)11Z(NNB)14(TGC)(NNB)3Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in Q70466-68.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2 wmtwaakrawrwwkkdavwwgakrwwkwvwhrassacmdwkaaktwkggwtwarrywkgr 61

This sequence represents a human or mammalian DNA replication origin
Consensus sequences of the invention, designated uniorsconsensus.
Consensus sequences of the invention, designated uniorsconsensus.
Consensus sequences of the invention, designated uniorsconsensus.
Administration of the consensus sequence or an anti-gene (comprising a double stranded copy of the consensus) is used to inhibit DNA replication of the vivo or in vitro. The consensus sequences can also be inserted into an expression vector, used subsequently for in vitro transfection of mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of semi-conservative replication in proliferating mammalian cells, or inserted into mammalian or human artificial chromosome vectors for gene the essential mammalian elements required for maintenance of corrections and large centromeric blocks for assembly of human conservation of the consensus sequence can be combined with cloned the consensus and large centromeric blocks for assembly of human conservation. The consensus assembly of successions of the consensus and antitained as bacterial plasmids, circular or incompleted.
Other specific peptides generated by these generic sequences are shown in RS5151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion that is chemically or biologically active they may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active moiety, eg. metal ion, radiolisotope, peptide, toxin or enzyme, to the specific target or on the monoclonal or polyclonal antibodies and therefore circumvent the need
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    inear, large or small yeast artificial chromosomes (YACs) or as episomal

Tractioning a recombinant vector library expressing fusion proteins proceeding a recombinant vector library expressing fusion proteins processing a binding domain and an effector domain proteins of the processing a binding domain and an effector domain proteins by a comprising a binding domain and an effector domain proteins of 20068 is a generic DNA Sequence used to generate random TSAR (Totally C 70468 is a generic DNA Sequence STALS generic formula can also be represented as follows: X(NNB)11(TGC) (NNB)7(TGC) (NNB)10Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in G7046-68.

C and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in G85151-54. TSARs are concatenated by these generic sequences are shown in G85151-54. TSARs are concatenated by these generic sequences are shown in a fiffility for a ligand and a second effector peptide portion that is chemically or a ligand and a second effector peptide portion that is chant the expressed peptide contains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues correspond and ascending a TSARs binding demain can be used in vivo to deliver a chemically or biologically active modety, eg. metal ion, and also replace the function of macromoleales.

C compression and rapid detection or in vivo antibody activity callowing direct and rapid detection in a screening process.
